# predatory flies

FROM MILJØFLUEN®  
TO YOUR STABLE

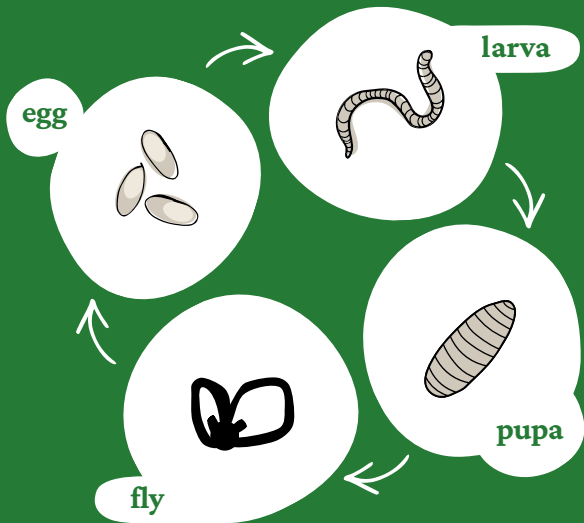

What you need to know about their life-span,  
delivery, activation and fly control with  
predatory flies.

– from the larvae and pupae which are packed  
and delivered to your stable, and to efficiency  
with a long life-span.

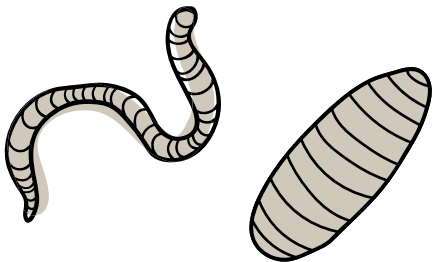

# predatory flies life cycle

6-8 WEEKS DEPENDING ON THE TEMPERATURE  
– THE WARMER THE FASTER

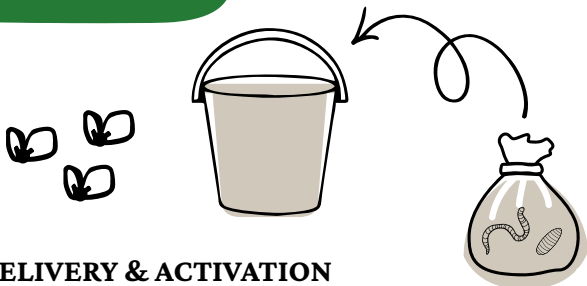

# week 1

## REARING

The predatory flies are reared at Miljøfluen® production facility in Denmark under **SPF-controlled** conditions and grows in a **unique formulated feed mixture**, ensuring healthy and viable beneficial insects. They are then prepared for delivery in the **larval and pupal stages**.

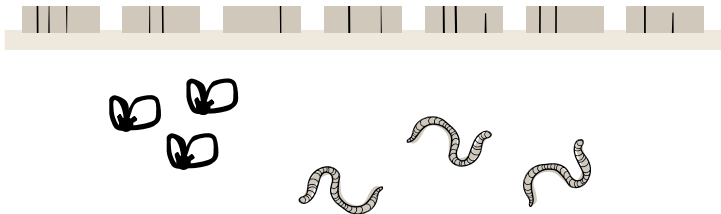

week 2-3

## DELIVERY & ACTIVATION

The predatory flies are machine-packed with protective material and feed to ensure proper oxygenation, low humidity, and the correct temperature during transport, so that the hatching of the flies proceeds optimally. You receive fresh predatory fly larvae and pupae, which hatch into **adult flies in the stable within 1–2 weeks**, depending on their developmental stage. The bag is **opened at the top and placed** in the supplied container, which is hung in a suitable location in the stable. *One bag covers 100 m<sup>2</sup>*

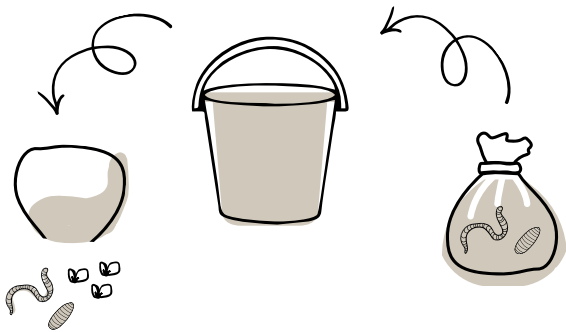

## week 3-5

### **FLY CONTROL**

If the weather is cold, the predatory fly larvae and pupae may go into a dormant state, which can result in reduced visible activity in the bag. The predatory flies resume their normal activity levels when exposed to warmth. The predatory fly pupae hatch gradually, and the larvae continuously control houseflies and stable flies beneath the slatted floor for 6–8 weeks.

## week 6-8

### NEW DELIVERY

Miljøfluen® supplies you automatically with a new bag of predatory flies every 6–8 weeks, depending on your delivery schedule. The contents of **the used bag are emptied into the channels**, while the bag itself is **disposed of as plastic waste**. A newly opened bag is placed in the suspended container.
